

Thursday Afternoon

Breakout Group 2: Inclusion/linking of economic and management issues in marine disease models

- Q1** - What management alternatives exist to reduce disease mortality in abalone populations?
- Q2** - What legal impediments exist limiting management alternatives? Is multispecies management important to reduce disease mortality?
- Q3** - For fished populations, is it feasible to estimate maximum-sustainable-yield and other biological reference points?
- Q4** - What parameters would be needed to implement the abalone model as an investigative tool to evaluate management options?
- Q5** - Is multispecies management important to reduce disease mortality?
