Depth-Averaged
Currents:
 $\downarrow(u_{dy}, v_{dx}) dz/\text{depth}$

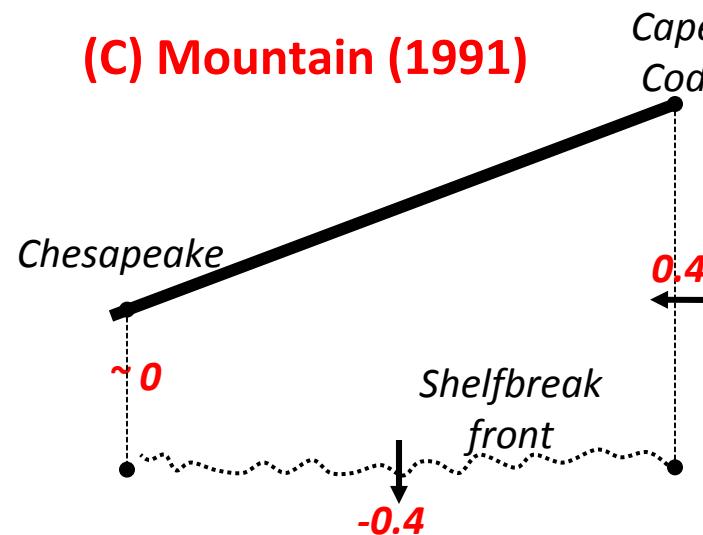

(A) Model (1993-1999 mean; Sv)

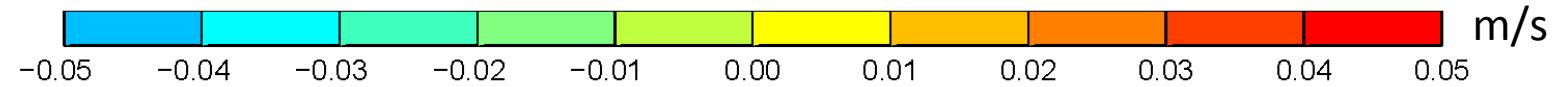

(B) Savidge & Bane (2001)

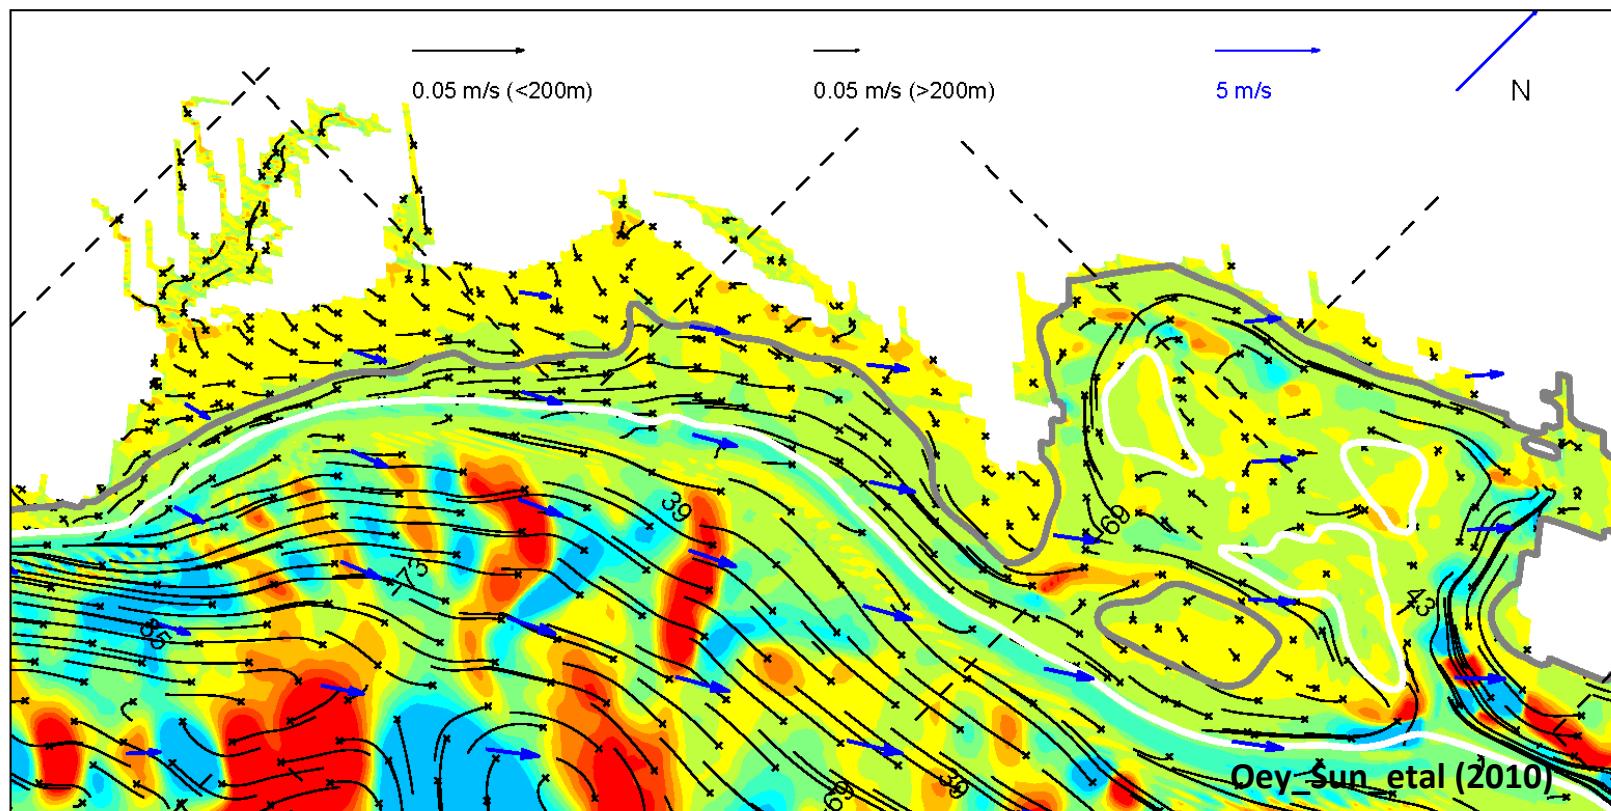

(C) Mountain (1991)

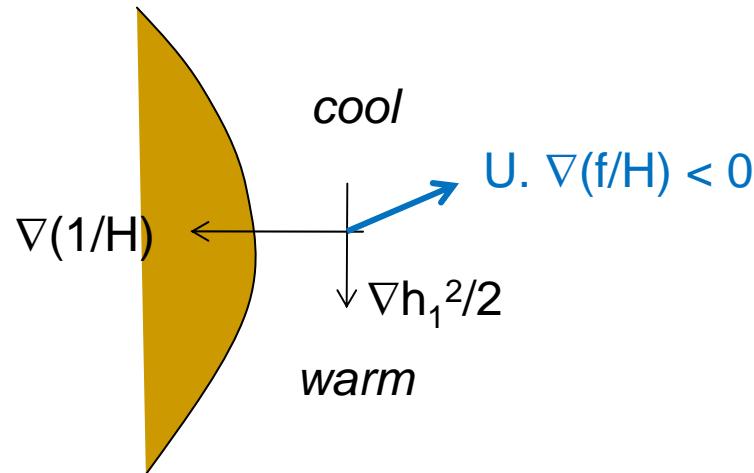

year: 1993–1999, $V(k=20)$ at $\text{grad}(-H)$

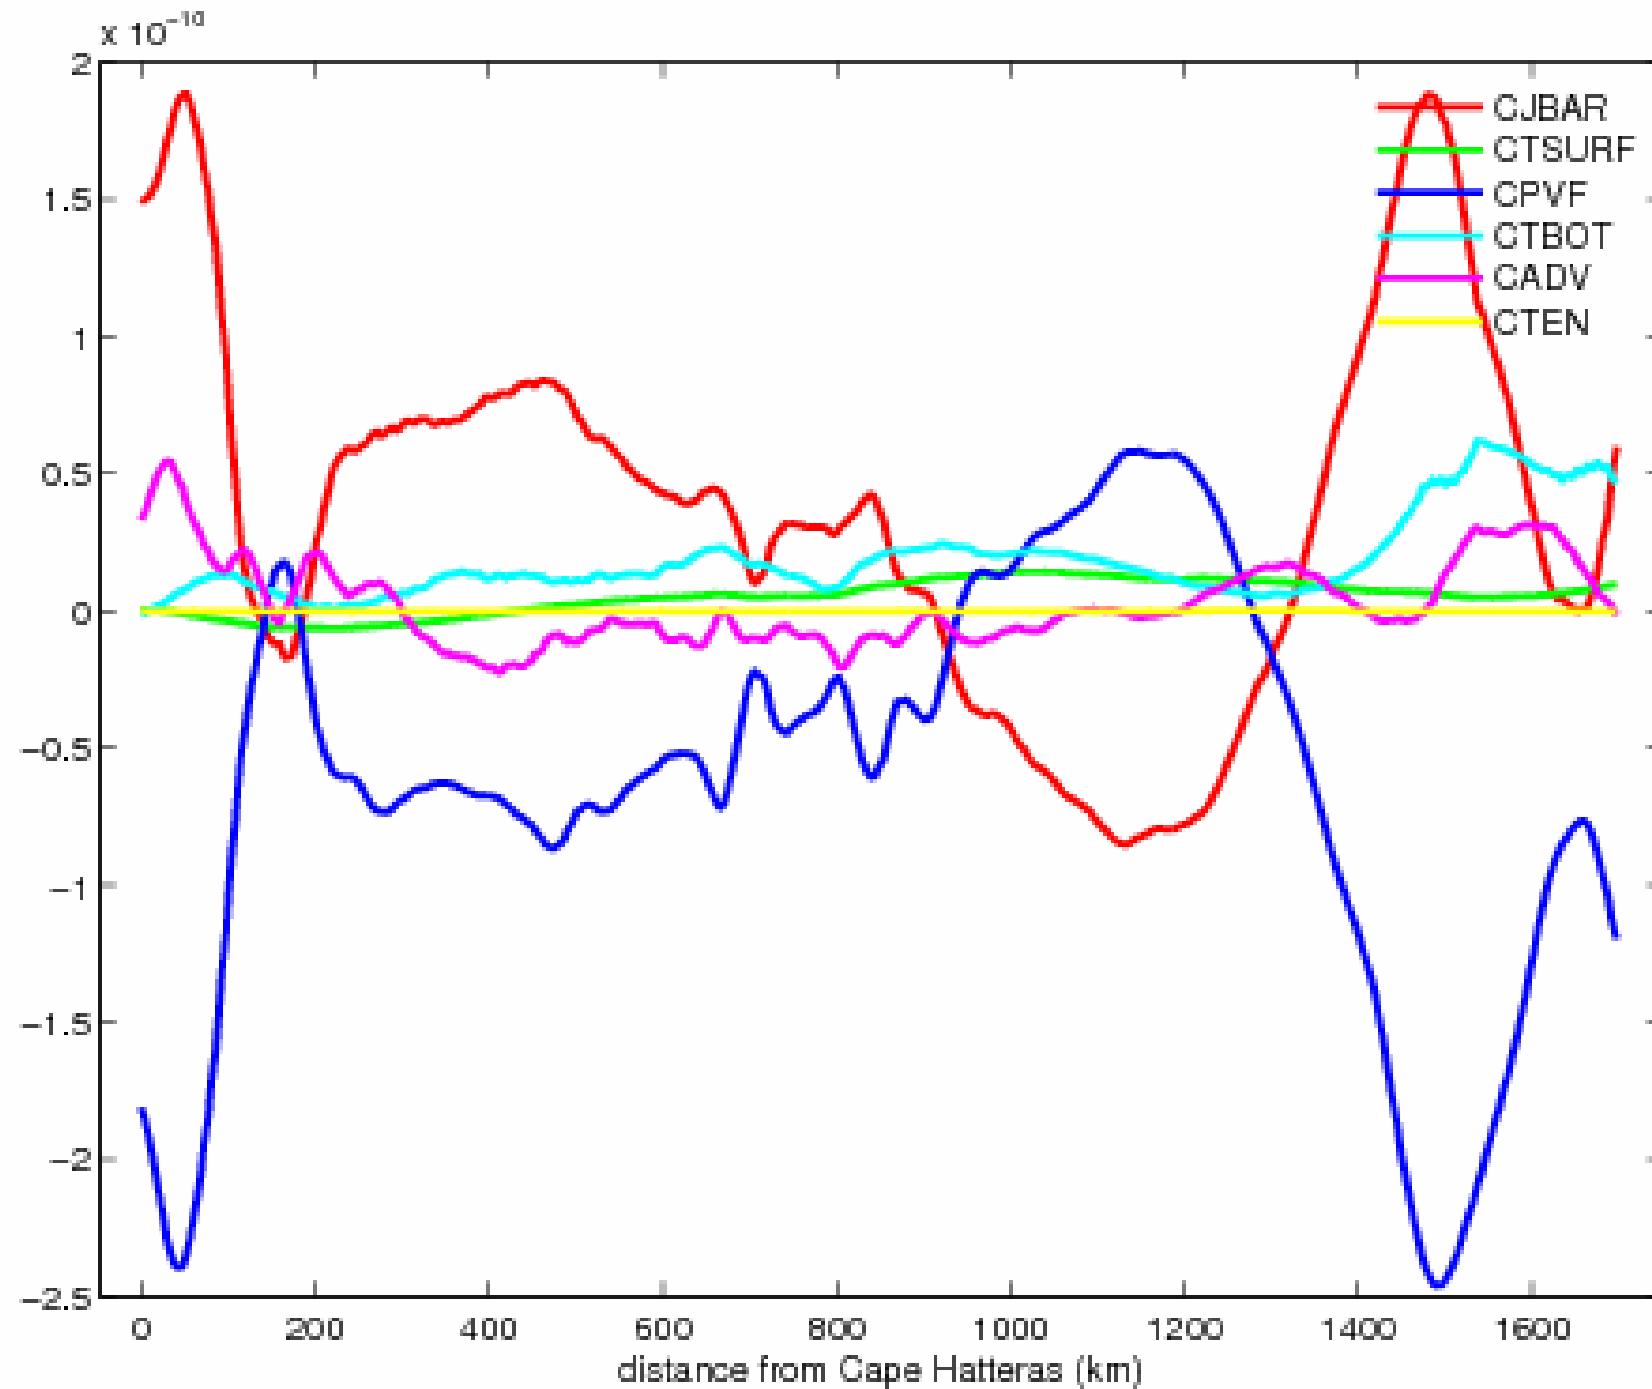

- (a) what drives the mean cross-shelf/slope flow? JEBAR & origin of pressure gradient?

$$U \cdot \nabla(f/H) = +g'k.[(\nabla h_1^2/2) \times \nabla(1/H)] - \nabla \cdot [(r/H)\nabla\psi]$$

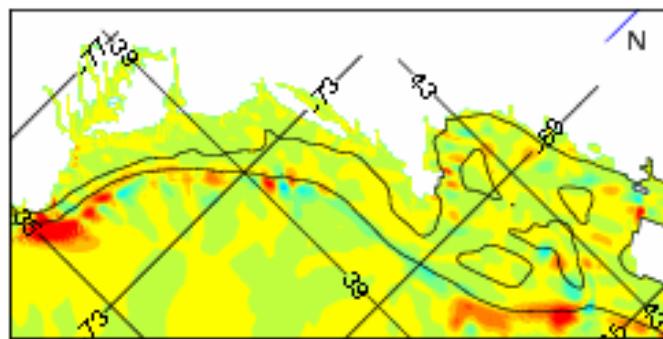

$$\zeta_t + \left(H \bar{u}\right) \cdot \nabla \left(\frac{f}{H}\right) = J(\chi, H^{-1}) + \nabla \times \left(\frac{\tau^o}{\tilde{\rho}_o H} - \frac{\tau_b}{\tilde{\rho}_o H} \right) - \nabla \times \left(\frac{A}{H} \right)$$

$$where: \chi = \int_{-H}^0 z \frac{g \rho}{\rho_o} dz$$

The BP Oil Spill of 2010

- Long-term projection
- Loop + Eddies + Winds
- Drifters are NOT oil
